Publication No. US20030096342A1

GENERAL INFORMATION:

APPLICANT: DING, SHILIAM S.

APPLICANT: ADNEY, WILLIAM S.

APPLICANT: HIRWEL, MICHALE B.

TITLE OF INVENTION: THERMAL TOLERANT CELLULASE FROM ACIDOTHERMUS

TITLE OF INVENTION: CELLULOLYTICUS

FILE REFERENCE: 40170-61991

CURRENT APPLICATION NUMBER: US/09/917,384

CURRENT PILING DATE: 2001-07-28

NUMBER OF SEQ ID NOS: 14

SOFTWARE: PATENTIN Ver. 2.1

SEQ ID NO 6

LENGTH: 1043

TYPE: PRT

ORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          OTHER INFORMATION: Description of Artificial Sequence: Segment of OTHER INFORMATION: GuxA

This work was done in collaboration with Haruo Ikeda(*1), Jun Ishikawa(*2), Akiharu Hanamoto(*3), Ghiguas Takahashi(*3), Mayumi Shinose(*3), Hiroshi Horikawa(*4), Hidekazu Nakazawa(*4), Tadayoshi Shiba(*5), Yoshiyuki Sakaki(*6,*7), Masahira Hattori(*1,*7)
and Satoshi Omura(*1,*3).
Final finishing process and all annotation were done by H. Ikeda and J. Ishikawa.
                                                                                                                                                                                                                                                                                                                                             Ikeda, H., Ishikawa, J., Hanamoto, A., Shinose, M., Kikuchi, H., Shiba, T., Sakaki, Y., Hattori, M. and Omura, S. Complete genome sequence and comparative analysis of the industrial microorganism Streptomyces avermitilis

Sunna,A., Gibbs,M.D. and Bergquist,P.L.
A novel thermostable multidomain 1,4-beta-xylanase from
'Caldibacillus cellulovorans' and effect of its xylan-binding
domain on enzyme activity
Microbiology 146 (Pt 11), 2947-2955 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Caldibacillus cellulovorans

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a GuxA polypeptide. GuxA is thermostable cellulase, and is a member of the glycoside hydrolase family of enzymes. GuxA is useful for reducing cellulose in a starting material such as agricultural biomass to sugars. This is useful in biofuel production. GuxA is also useful in the conversion of biomass to biofuels and biofuel additives, in detergents, pulp and paper processing, food and feed processing, and in textile process. GuxA is also useful for raising polyclonal and monoclonal antibodies that are useful in purifying GuxA, or detecting GuxA polypeptide expression, as well as reagent tools for
                                                                                                                                                                                                                                                                                                                                 Novel thermal tolerant GuxA polypeptide derived from Acidothermus cellulolyticus, useful for reducing cellulose in a starting material, for the conversion of biomass to biofuels and biofuel additives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ValSerGlyGlyValLysValGlnTyrLysAsnAsnAspSerAlaProGlyAspAsnGln

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes ManA, a thermostable mannanase A polypeptide derived from Acidothermus cellulolyticus. ManA is a member of the glycoside hydrolase family of enzymes. ManA is useful for reducing hemicellulose in a starting material to simpler carbohydrate units, and ultimately to sugars which are useful in the food, feed, paper pulp, and biofuels industries. It is useful for the processing of food and in food stuffs as bulking agents, and for the degradation of mannase. ManA is also useful to raise polyclonal and monoclonal antibodies that are useful in purifying ManA, or detecting ManA polypeptide expression, and as well as reagent tools for characterizing the molecular actions of ManA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      40

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a thermostable avicelase polypeptide, designated AviIII. AviIII is a member of the glycoside hydrolase family of enzymes, and is a cellulase. AviIII is meatul in the conversion of biomass to biofuels and biofuel additives. It may be useful in the processing and in textile processes. The thermostable AviIII peptide is useful in the degradation of cellulose, and in generating specific anti-polypeptides that are useful in purifying recombinant AviIII polypeptide from genetically engineered host cells, in detecting AviIII polypeptide expression, as well as a reagent tool for characterizing the molecular actions of the polypeptide. The AviIII polymucleotide is useful
                                                                                                                                                                                                                                                                                                                                                                   New thermostable AviIII peptide from Acidothermus cellulolyticus, useful for degradation of cellulose or in generating anti-AviIII antibodies for purifying recombinant AviIII polypeptides from genetically engineered host cells.

```
New isolated thermal tolerant avicelase polynucleotide useful for detection of a polynucleotide encoding AviIII and for reducing cellulose in a starting material, e.g. municipal solid waste.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polynucleotide molecule encoding thermostable Avilli polypeptide. The polynucleotide is useful for detection of a polynucleotide encoding Avilli. The polynucelotide is useful for setting to reducing cellulose in a starting material which involves administering to the starting material, e.g. agricultural biomass or municipal solid waste, a polypeptide molecule of the polynucleotide. The method further comprises administering a second polypeptide molecule chosen from the glycoside hydrolase family of proteins. The present sequence represents DNA encoding the Acidothermus cellulolyticus

```
polypeptide is useful in the degradation of cellulose into biofuel, or for conversion of biomass to biofuel additives. It is used in detergents, pulp and paper processing, food and feed processing, and in textile processing. It can also be used alone or in combination with other cellulase or glycoside hydrolases. The novel polypeptide generates alternative cellulase enzymes capable of assisting in the commercial. Scale processing of cellulose to sugar for use in biofuel production. The present sequence represents a A. cellulolyticus Guxl cellulase encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a thermal tolerant Guxl peptide from A. cellulolyticus. The Guxl exoglucanase is a member of the glycoside hydrolase family and comprises a catalytic domain GH48, carbohydrate binding domain type III, and a carbohydrate binding domain type II. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New thermal tolerant Guxl peptide having specified amino acid sequence, useful in the degradation of cellulose to biofuels.

                                                                                       The plasmid, pAEC 1, was prepd. ligating chromosomal DNA contg. the gene (obtd. from Aeromonas) into pUC18. The gene can be used to produce recombinant enzyme which is used for the effective utilis- ation of biomass resources and the mfr. of pharmaccuticals and foodstuffs, and also for the detergent and delinking of waste paper. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 27-AUG-2003 to correct OS field.)

The invention relates to a recombinant cellulase active protein free of proteinases of native thermophilic and alkalinophilic origin, comprising the truncated sequences Cel B5, Cel B4/5, Cel B1/2, Cel 1/2/3, Cel 6 or Cel B3/B5, or a stability region from one of the defined full-cel or Cel 6 or Cel B3/B5, or a stability region from one of the defined full-cel or K1425 or K1425 or N1426, and Cel B4/5 extends from amino acid K655 to N1426 in the sequence shown in AAV13492; Cel E1 extends from amino acid X93 to D481, Cel E6 extends from x19 to G635, Cel E1/2/3 and the stability region extends from amino acid V133 to K1751 and the stability region extends from amino acid V133 to K1751 and the stability region extends from amino acid V133 to K1751 and the stability region extends from amino acid V139 to G635 in the carymes are useful in laundry detergent compositions to prevent or remove staining backstaining or graying, for use on cellulosic materials including cotton-containing fabries. They are especially useful for preventing redeposition of colorant during stonewashing, and for truncated enzymes show reduced redeposition of dye compared to using nontrinoated enzymes show reduced redeposition of dye compared to using nontrinoated enzymes show reduced redeposition of dye compared to using non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Active cellulase protein; alkalinophilic; textile processing; proteinase;

The present invention relates to a cellulase active protein, which is substantially free of proteinases of native thermophilic and alkalinophilic origin, where the cellulase active protein consists of the CelBS amino acid sequence. The cellulase active protein is useful for treating cellulosic materials including cotton-containing fabrics, as detergent additives. The cellulase active protein is also useful for improving the feel and/or appearance of cotton-containing fabrics, for removing surface fibers from cotton-containing whits or for imparting stonewashed appearance to cotton-containing denims. The present proteins are stable under condition of alkaline pH and elevated temperatures, thus suitable for textile processing and in commercial detergents. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                        or commercial

The invention relates to a recombinant cellulase active protein free of proteinases of native thermophilic and alkalinophilic origin, comprising the truncated sequences Cel B3, Cel B4/5, Cel B1/2, Cel 1/2/3, Cel 6 or Cel E3/B5, or a stability region from one of the defined full-length sequences, or functional equivalents. Cel B5 extends from amino acid A1011 to P1424 or K1425 or N1426, and Cel B4/5 extends from amino acid A1011 to P1424 or K1425 or N1426, and Cel B4/5 extends from amino acid X33 to D481, Cel E1/2 extends from Y39 to G812, Cel E1/2 EL/2/3 extends from Y39 to G812, Cel E1/2 extends from y39 to G812, Cel E3/B5 is the sequence shown in A4V13493; Cel E3/B5 is the sequence shown in A4V13493; Cel E3/B5 is shown in A4V13494. The new carying, backstaining or graying, for use on cellulosic materials including octton-containing fabrics. They are especially useful for preventing redeposition of colorant during stonewashing, and for preventing redeposition of colorant during stonewashing, and for truncated enzymes show reduced redeposition of dye compared to using non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New truncated cellulase proteins, useful in detergents and for producing 'stonewashed' denim.

celBS amino acid sequence. The cellulase active protein is useful for treating cellulosic materials including cotton-containing fabrics, as deterement additives. The cellulase active protein is also useful for improving the feel and/or appearance of cotton-containing fabrics, for removing surface fibers from cotton-containing knits or for imparting stronwashed appearance to cotton-containing denims. The present proteins are stable under condition of alkaline pH and elevated temperatures, thus suitable for textile processing and in commercial detergents. The present

/product= "DNA encoding B/5 protein"

```
The invention relates to a recombinant cellulase active protein free of proteinases of native thermophilic and alkalinophilic origin, comprising the truncated sequences Cel B5, Cel B4/5, Cel E1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel 1/2, Cel

The present invention relates to a cellulase active protein, which is substantially free of proteinases of native thermophilic and alkalinophilic oxigin, where the cellulase active protein consists of the CelBs amino acid sequence. The cellulase active protein is useful for treating cellulosic materials including cotton-containing fabrics, as detergent additives. The cellulase active protein is also useful for improving the feel and/or appearance of cotton-containing fabrics, for removing surface fibers from cotton-containing whits or for imparting stonewashed appearance to cotton-containing whits or for imparting sure stable under condition of alkaline pH and elevated temperatures, thus sequence is celB gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4038 GGTTTGAAGGTACTATACAAGAACAATGAGACAAGTGCGAGCACAAGTTCTATAAGGCCG 4097

The invention relates to methods for preparing a protein surfacedisplayed on a genetic carrier, improving a protein or isolating a bubstance in a mixture comprising transforming a host cell harbouring a genetic carrier consisting of a spore or virus with the vector library. The method is useful for surface display of proteins, particularly for displaying a protein on the surface of e.g. spores, for improving a protein, or for isolating a substance. These methods are useful in obtaining monoclonal variants from a large library, or in high-throughput screening of antibodies for use in therapy (e.g. as vaccines), diagnosis of analysis. This polymucleotide sequence represents the CMCase gene with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for surface display of proteins, e.g. displaying a protein on the surface of spores, improving a protein or isolating a substance, by transforming a host cell harboring a genetic carrier with spore or virus

The invention relates to methods for preparing a protein surfacedisplayed on a genetic carrier, improving a protein or isolating a substance in a mixture comprising transforming a host cell harbouring a genetic carrier consisting of a spore or virus with the vector library. The method is useful for surface display of proteins, particularly for displaying a protein on the surface of e.g. spores, for improving a protein, or for isolating a substance. These methods are useful in obtaining monoclonal variants from a large library, or in high-throughput screening of antibodies for use in therapy (e.g. as vaccines), diagnosis or analysis. This polymucleotide sequence represents the CMCase gane with a mutated signal sequence to enhance its hydrophobicity relating to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Methods for surface display of proteins, e.g. displaying a protein on the surface of spores, improving a protein or isolating a substance, by transforming a host cell harboring a genetic carrier with spore or virus with the vector library.

The present invention relates to a new method for displaying a protein of interest on a spore surface. The method of the invention involves containing a vector comparising a gene construct containing a gene encoding a spore coat protein and a gene encoding a protein of interest, a surface of a spore of the host cell, and recovering the combinant live vaccine. The method is also useful for producing a delivery system for recombinant live vaccine. The method is also useful for improving a sporte. The method is useful for producing a delivery spore, in combinant live vaccine. The method is also useful for improving a protein of interest using a resistance property of spore, in conversion reactions, for preparing protein microarray, for producing an antibody to antigen in vertebrates, and for preparing a whole cell carboxine. The spore coat proteins used circumvent a necessity for passage across cell membrane, so that they do not need secretion signal and carry a surface display of protein, such as beta-galactosidase, in corderly fashion, which is difficult to pass across cell membrane. The protein cotd-carboxymethyl cellulase (CMCase) fusion protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2170
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ||||||||::

/clone pollen: Pollen vacuolated-vacuolated stage of development. Pollen was harvested from greenhouse-grown panicles of sorghum line BTx623. Panicles were removed from the flag leaf prior to emergence, when no detectable amylase is present in pollen of male-fertile lines. This stage represents pollen collected from anthers about 8-14 days prior to anthesis. Double-stranded cDNA was cloned unidirectionally into different DraIII sites of the pME18S-FL3 vector (5-prime DraIII site is CACGATGTG). XhoI excises the CDNA

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in
the Human Genome Center, University of Tokyo Institute of Medical
Science, plant material and RNA prepared at Texas A & W University,
sequencing done in the Laboratory for Genomics and Bioinformatics,
University of Georgia. Sequence ends have been trimmed to exclude
vector and regions below Phred quality 16. Three-prime sequences
are presented as their reverse complement and have been trimmed to
exclude polyA.
Seq prime: Sug3-14 (TAGTCTAGCGGCGGACC)
